

Pediatric Integrated Care Three-Part Webinar Series

Pediatric integrated care is an important way to promote high quality mental health care for children and families who face high barriers to care and limited access to mental health resources. Integrated care promotes health equity and improves quality of care by relieving the patient of the expectation to navigate multiple health systems and decreasing stigma of mental health care by providing it in a primary care setting. This webinar will provide an overview of the pediatric integrated care model and will explore how it is implemented.
